1 The zip files

SIMFIT is a large package and, to allow programmers to compile subsections of the package, for instance just the SIMFIT GUI, or only one or a selection of the NAG library routines used by SIMFIT, the code is available from <http://www.simfit.org.uk> in several forms.

At versions 6 and 7 the SIMFIT and SIMDEM codes are distributed in the following zip files where x is the version (usually 6 or 7), y is the level and z is the release number at level y .

```
demzipx_y_z.zip ... the Simdem package
simzipx_y_z.zip ... the Simfit package
manzipx_y_z.zip ... the reference manual
nagzipx_y_z.zip ... the NAG library interfacing code
naglibx_y_z.zip ... The NAG library source code
```

Note that the Fortran source in these zip files has been compiled and run successfully using FTN95, NAGfor, and gFortran under the strictest checking options. Most of the SIMFIT codes do not require the Windows API, and those that do are collected together in the `clearwin` and `clearwin64` folders, and they have a `w_` underscore prefix as in `w_config.for`. The driver programs `w_simfit.exe` and `x64_simfit.exe` also use the Windows API.

These zip files are intended for the following uses.

- **The demzip package**
Only provides code necessary to compile and link the SIMFIT GUI, that is the SIMDEM package.
- **The simzip package**
This is the complete code for the whole of the SIMFIT package.
- **The manzip package**
All the \LaTeX sources and graphics files needed to create the SIMFIT reference manual.
- **The nagzip package**
This is provided for users who wish to upgrade SIMFIT to use a new release of the NAG library DLLs.
- **The naglib package**
This code enables users to compile all the NAG library codes used by SIMFIT or a subsection of these codes.

1.1 The SIMFIT tree

The zip files used to distribute the SIMFIT codes assume the following code tree structure of folders below the top-level `simzip` folder.

```
\simzip\work
\simzip\dll\simfit
\simzip\dll\clearwin
\simzip\dll\clearwin64
\simzip\dll\menus
\simzip\dll\graphics
\simzip\dll\maths
\simzip\dll\models
\simzip\dll\nag
\simzip\dll\numbers\...
```

- **The work folder**

All the source codes, icons, batch files and link scripts used to compile the SIMFIT package driving programs.

These codes must be linked to codes in the other folders, usually the DLLs

```
w_simfit.dll      (or x64_simfit.dll)
w_clearwin.dll   (or x64_clearwin.dll)
w_menus.dll      (or x64_menus.dll)
w_graphics.dll   (or x64_graphics.dll)
w_maths.dll      (or x64_maths.dll)
w_models.dll     (or x64_models.dll)
w_numbers.dll    (or x64_numbers.dll)
```

- **The dll simfit folder**

Subroutines called from the driving programs. These codes must be linked to codes in the other folders, usually the DLLs

```
w_clearwin.dll   (or x64_clearwin.dll)
w_menus.dll      (or x64_menus.dll)
w_graphics.dll   (or x64_graphics.dll)
w_maths.dll      (or x64_maths.dll)
w_models.dll     (or x64_models.dll)
w_numbers.dll    (or x64_numbers.dll)
```

- **The dll clearwin folder**

Part of the SIMFIT GUI.

The interface to 32-bit Clearwin. Includes html and jpg codes as well as *.for subroutines.

This code is free-standing and must not be linked to any of the other SIMFIT folders.

- **The dll clearwin64 folder**

Part of the SIMFIT GUI.

The interface to 64-bit Clearwin. These subroutines have the same names as those in the clearwin folder but are in free format *.f95 to avoid confusion.

This code is free-standing and must not be linked to any of the other SIMFIT folders.

- **The dll menus folder**

Part of the SIMFIT GUI.

These subroutines filter calls from elsewhere into a form suitable for calling routines in the clearwin or clearwin64 folders. There are also free-standing items to control input/output.

This code must be linked to the clearwin code, usually in w_clearwin.dll or x64_clearwin.dll.

- **The dll graphics folder**

Part of the SIMFIT GUI.

Code to prepare graphics calls before calling items in the clearwin or clearwin64 folders. These codes must be linked to codes in the other folders, usually the DLLs

```
w_clearwin.dll   (or x64_clearwin.dll)
w_menus.dll      (or x64_menus.dll)
```

- **The dll maths folder**

Subroutines with the same names and calling sequences as the NAG library. This code is linked into the academic version of SIMFIT. It must be linked to w_numbers.dll or x64_numbers.dll.

- **The dll nag folder**

Subroutines with the same names as those in the maths folder except that they are *.f rather than *.for. This code is linked to the NAG library DLLs so that the NAG version of SIMFIT calls the NAG library rather than the SIMFIT maths library,

- **The dll models folder**

Subroutines for user-supplied models.

These codes must be linked to codes in the other folders, usually the DLLs

```
w_maths.dll (or x64_maths.dll)
w_numbers.dll (or x64_numbers.dll)
```

- **The dll numbers folder**

Public domain code for numerical analysis called by SIMFIT and subroutines in the maths folder.

This code is free-standing and must not be linked to any of the codes in the other SIMFIT folders.

1.2 The SIMDEM tree

The SIMDEM package is intended to demonstrate to Fortran programmers how to write Fortran programs that use the Windows API to create menus, tables, and graphs without knowing anything about the API. All the subroutine arguments are in standard Fortran and, as it relies on the FTN95 Clearwin functionality and runtime system, it is only useful for Windows programming.

The zip files used to distribute the SIMDEM codes assume the following code tree structure of folders below the top-level demzip folder.

```
\demzip\dll\clearwin
\demzip\dll\clearwin64
\demzip\dll\menus
\demzip\dll\graphics
\demzip\chm
\demzip\extras
\demzip\for
\demzip\f95
\demzip\nag
\demzip\txt
```

The zip files used to distribute the SIMDEM codes assume the following code tree structure of folders below the top-level folder.

- **The chm folder**

HTML files to create the simdem.chm compiled HTML help file.

- **The dll folder**

The SIMFIT GUI as explained for the SIMFIT zip files.

- **The extras folder**

Auxiliaries.

- **The f95 folder**

Free format code.

- **The for folder**

Fixed format code.

- **The html folder**

HTML files for the free-standing SIMDEM help program.

- **The nag folder**

Test files to demonstrate NAG library procedures.

- **The txt folder**

Text files.

2 Overview

Experienced users can just go to the final section on makefiles where there are the sequences of command lines necessary to compile and link the `SIMFIT` and `SIMDEM` packages. These can be used to construct makefiles if makefiles are not distributed with the codes. Otherwise, details and examples follow.

2.1 Websites

The `SIMFIT`, `SIMDEM` and `LATEX` source codes can be downloaded as zip files from

<http://www.simfit.org.uk>

and they should be unzipped into the tree structures provided. However, it may be necessary to change the logical drives (e.g. C: instead of D:) or edit some paths to get all of the batch files and link scripts to work.

Note that the utility program **for2f95**, distributed with the `SIMDEM` package, can be used to transform *.for files into *.f95 files, if that is required. It was designed to respect features of the code employed to aid readability and checking and should be used rather than general purpose fixed to free translators which will destroy such carefully designed structures.

There are also two `SIMFIT` mirror sites as follows.

<http://simfit.usal.es>

<http://simfit.silverfrost.com>

2.2 Summary

`SIMFIT` and `SIMDEM` at version 6 can be compiled and linked in such a way that there are no cross compiler problems, and the resulting packages will run in all versions of Windows, as well as Linux under Wine, and Macintosh under VMware or Crossover. Details are given for Silverfrost FTN95, which must be used without the `/f_stdcall` switch for standard cdecl Silverfrost applications, but with the `/f_stdcall` switch for the NAG library versions, and also for NAGfor which must be used with the `-compatible` switch for NAG DLL applications.

This is very important, and is mentioned several times in this document for emphasis, as failure to observe the advice about not mixing cdecl and stdcall binaries leads to run time crashes that can be very difficult to trace.

To compile and link `SIMFIT` to only create the Academic versions then there is no need to use the `STDCALL` calling convention, but for versions that may be linked to the NAG library DLLs it is vital to use the `STDCALL` calling convention. It is not possible to mix binaries with both calling conventions. If the NAG library is going to be used with FTN95 then all the code must be compiled using the `/f_stdcall` compiler switch, and with NAGfor the compiler switch `-compatible` must be used everywhere.

The default installation schemes for the packages are as follows.

For `SIMDEM`

| | |
|-----------------------------|----------------------------------|
| C:\Program Files\Simdem\bin | ... binaries |
| C:\Program Files\Simdem\dem | ... demonstration test data sets |
| C:\Program Files\Simdem\doc | ... documentation |
| C:\Program Files\Simdem\f95 | ... free format code |
| C:\program Files\Simdem\for | ... fixed format code |

For SIMFIT

```
C:\Program Files\Simfit\bin ... binaries
C:\Program Files\Simfit\dem ... demonstration test data sets
C:\Program Files\Simfit\doc ... documentation
```

With 64-bit Windows the installation would be in the following tree

```
C:\Program Files (x86)
```

The source code has been written to be consistent with these structures. Some other features are now considered.

2.3 FTN95 and w_clearwin.dll

All the Silverfrost-specific calls are now in just one dynamic link libraries, namely `w_clearwin.dll`. This must be compiled using Salford-Silverfrost FTN95, as it uses `winio@` and other calls that rely on the Silverfrost run time system, `salflibc.dll`. From Version 6.8.1 the files

`w_clearwin.dll`,

`run6`, and

`change_simfit_version`

are now the only parts of SIMFIT that are FTN95 specific and rely on `salflibc.dll`.

`w_clearwin.dll` does not use `open`, `close`, `inquire`, `backspace`, `rewind`, `read`, `write`, or any actions that would restrict cross-compiler use.

2.4 FTN95 and compiled HTML

All the compiled HTML help for the SIMFIT and SIMDEM executables is in `w_clearwin.dll` which must be compiled using Silverfrost FTN95. A compiled HTML SIMDEM help file called `simdem.chm` is now installed by the SIMDEM installation package.

2.5 change_simfit_version.exe and NAG DLLs

There is a SIMFIT program called **change_simfit_version** that can be compiled using FTN95, or could easily be re-written to be compiled by any compiler. This program can do the following tasks:

```
Overwrite w_maths.dll using academic_maths.dll
Overwrite w_maths.dll using fld1120_maths.dll
Overwrite w_maths.dll using fld11214a_mkl.dll
Overwrite w_maths.dll using fld11214z_mkl.dll
Overwrite w_maths.dll using fld11214a_nag.dll
Overwrite w_maths.dll using fld11214z_nag.dll
Overwrite w_maths.dll using *****.dll
```

and is configured by the file `change_simfit_version.config`. This results in a consistent version of SIMFIT that is either free standing (Academic) or NAG DLL based. The package can also be distributed without the utility

change_simfit_version.exe,

but fixed into one of these configurations. The SIMFIT program **change_simfit_version.exe** can be run as administrator but only when SIMFIT is switched off so as to not be linked to `w_maths.dll`. The Academic and NAG versions only differ in the version of `w_maths.dll` that is in the same folder as the rest of the SIMFIT binaries.

Program **change_simfit_version** does not use `open`, `close`, `inquire`, `backspace`, `rewind`, `read`, `write`, or any actions that would restrict cross-compiler use.

2.6 w_simfit.exe

The SIMFIT driver program `run6.exe = w_simfit.exe` must be compiled using FTN95 but could, with some difficulty, be replaced by a new driver written for any compiler, using any language. It links to object code from `dllchk.for` which must be edited for a correct signature.

`run6 = w_simfit` does not use `open`, `close`, `inquire`, `backspace`, `rewind`, `read`, `write`, or any actions in such a way as to restrict cross-compiler use.

2.7 Cross compiler issues

If the main programs and dynamic link libraries are compiled and linked using the same compiler, e.g. FTN95, NAGfor, etc., there will be no cross compiler problems, as all `open`, `close`, `read`, `write`, `inquire`, etc. will be using the same run-time system. The resources can be compiled using the Silverfrost SRC compiler or using other resource compilers, such as `windres` supplied with MinGW `gcc` and NAGfor. The HTML required by `w_clearwin.dll` can only be compiled using SRC.

In the SIMDEM examples documentation it is explained how to use special subroutines and functions to perform, `read`, `write`, `open`, `close`, `inquire`, etc. to circumvent the situation where code calling the SIMDEM GUI is not compiled by the same compiler as the GUI.

2.8 File extensions

```
*.f95 ... Fortran95 file in free format
*.for ... Fortran77 file in fixed format(main programs and dll)
        Some are single routines but many are composite.
        Some use long names and allocate/deallocate.
*.ins ... Fortran77 file in fixed format(included routines)
        Some are single routines but many are composite.
        Some are .ins files defining common blocks etc.
        These are being phased out in favour of modules.
*.f ... Front end code for the NAG library calls
*.rc ... Resource script for SRC (the Salford resource compiler)
        These can also be compiled using windres.
*.ico ... Icon (for *.rc scripts)
*.htm ... HTML script (for *.rc script)
*.link ... Link script for SLINK (the Salford linker) or NAGfor
*.bat ... MS DOS batch file
*.tex ... LaTeX script
*.wgb ... EPS file minus the prolog (prolog.wgb)
*.eps ... EPS file
*.cpp ... C code
```

2.9 Scripts

The source codes, when unzipped, contain batch files and link scripts, so that the process is extremely simple. The batch files all suppose that Silverfrost FTN95 is on the path, but this is only strictly necessary for three items:

```
w_clearwin.dll ... Simfit and Simdem
run6.exe = w_simfit.exe ... Simfit only
change_simfit_version.exe ... Simfit only
```

Otherwise, by making appropriate replicas of the batch files and link scripts, any Fortran compiler can be used.

It is also assumed that the source codes for

```
w_clearwin.dll
w_menus.dll
w_graphics.dll
```

are identical in the `SIMDEM` and `SIMFIT` packages. In the event of dedicated NAG and Silverfrost versions, in future this may not always be the case.

3 Source codes

Download and unzip the latest `versionx_y_z` zip files as follows:

```
demzipx_y_z.zip ... the Simdem package
simzipx_y_z.zip ... the Simfit package
manzipx_y_z.zip ... the reference manual
nagzipx_y_z.zip ... the NAG library interfacing code
naglibx_y_z.zip ... The NAG library source code
```

The `SIMDEM` package will be unzipped into `C:\demzip`

The `SIMFIT` package will be unzipped into `C:\simzip`

The reference manual will be unzipped into `C:\manzip`

The NAG library interfacing code will be unzipped into `C:\nagzip`

The NAG library source code will be unzipped into `C:\naglib`

After unzipping, the source codes can be used to update existing installations.

If you decide to unzip elsewhere it will all be very much harder

Note that the source codes for

```
w_clearwin.dll
w_menus.dll
w_graphics.dll
```

in `demzip6_x_y.zip`, `simzip6_x_y.zip`, and `nagzip6_x_y.zip` may not always be identical.

3.1 Code style

The `SIMFIT` code does contain some obsolescent features, e.g. `COMMON` blocks and `GOTOs`, but I am steadily replacing these. There are no equivalences, entries, Holleriths, subroutine calls creating side effects, or any of the well known howlers that Fortran allows.

All subroutines are heavily commented, but observers will note how the style has changed progressively from the days when we had to trap errors using things like

```
READ (NIN,100,END=20,ERR=40)
```

so that, in general, routines in upper case with labels and `GOTOs` will tend to be older than code in lower case with things like

```
read (nin,100,iostat=ios)
if (ios.ne.0) then...
```

At one stage the code never used things like

```
DO I = 1, N
  K(I) = L(I + 1) + 2
ENDDO
```

because of confusion between INTEGER*1, INTEGER*2, and INTEGER*4, and there are many integers defined in parameter statements because of this, as in

```
INTEGER    N1, N2
PARAMETER (N1 = 1, N2 = 2)
...
DO I = N1, N
    K(I) = L(I + N1) + N2
ENDDO
```

Subsequently, I did maintain this feature so that integers used explicitly in a subroutine were all declared and could be easily traced.

Another feature is that I tend to use argument lists like this

```
CALL SOME_THING (I, J, K,
                 A, B, C,
                 XTITLE, YTITLE, ZTITLE,
                 ABORT, OK, QUIT)
```

with integers, then double precisions, then characters, then logicals, all in alphabetical order within their type. This helps type checking but was not always done with older code.

Note that using code with unnecessary continuation lines like

```
call putadv (
+'Input a file like manoval.tf1')
```

instead of just

```
call putadv ('Input a file like manoval.tf1')
```

was adopted to make the work of the Spanish translators easier

3.2 Signatures

All SIMFIT programs have signatures to identify the version and release numbers, and these are constantly checked during normal operation so that users can be warned of any inconsistencies. All binaries in a SIMFIT installation must have the same signature, so you must edit the signature codes for version and release numbers as follows:

For the SIMDEM package:

```
C:\simfit6\dll\menus\dllmen.for
C:\simfit6\dll\graphics\dllgra.for
C:\simfit6\dll\clearwin\dllclr.for
C:\simdem\simdem.for
C:\simdem\for\simdem.for
C:\simdem\f95\simdem.f95
```

For the SIMFIT package:

```
C:\simit6\work\dllchk.for
C:\simfit6\dll\simfit\dllsim.for
C:\simfit6\dll\menus\dllmen.for
C:\simfit6\dll\graphics\dllgra.for
C:\simfit6\dll\models\dllmod.for
```

```

C:\simfit6\dll\numbers\dllnum.for
C:\simfit6\dll\clearwin\dllclr.for
C:\simfit6\dll\maths\dllmat.for
C:\simfit6\dll\nag\dllmat_mark20.f ... now done by makenag.bat
C:\simfit6\dll\nag\dllmat_mk1214a.f ... now done by makenag.bat
C:\simfit6\dll\nag\dllmat_mk1214z.f ... now done by makenag.bat
C:\simfit6\dll\nag\dllmat_nag214a.f ... now done by makenag.bat
C:\simfit6\dll\nag\dllmat_nag214z.f ... now done by makenag.bat

```

For **change_simfit_version.exe** in the SIMFIT package edit the file `change_simfit_version.config` stored in the `C:\setup\programs` folder.

For the reference manual version and release numbers:

```

C:\manuals\manual0\color.tex
C:\manuals\manual0\mono.tex

```

4 Compilers

Examples are given for Silverfrost FTN95 and NAGfor but, except for one essential item and three nonessential auxiliary items for which FTN95 must be used, any Fortran compiler can be used. Note that most compilers can create binaries consistent with either the `cdecl` calling convention, or the `stdcall` calling convention. It is possible to link executables to DLLs built using either convention but, in general, it is best to use just one of these conventions, e.g. `stdcall` for Excel, Visual Basic, NAG library DLLs, etc. 64-bit versions can also be compiled using NAGfor or gFortran.

4.1 Example 1: FTN95 and `w_clearwin.dll`

As an example of how to use FTN95, the complete procedure for creating `w_clearwin.dll` will be described. This DLL is an essential part of SIMFIT and SIMDEM and must be compiled using the Silverfrost FTN95 compiler.

4.1.1 Configuring FTN95

First of all, the command

```
ftn95 /config
```

must be used to configure the compiler for either

- a) `cdecl` (default) for some C programs, or
- b) `stdcall` (for VB, Excel, NAG DLLs, Windows API, etc.)

Note that `/f_stdcall` compromises some `/checkmate` functionality.

4.1.2 Compiling the resources

Icons and HTML source code must be compiled into object code using the resource compiler `SRC` where necessary (for the one essential item and the three FTN95-specific auxiliary items).

For example, this command issued from the `C:\simfit6\dll\clearwin` folder

```
src ico_clr
```

will use the script file `ico_clr.rc` to compile the `*.ico`, `*.htm`, and `*.jpg` files into an object file for loading into `w_clearwin.dll`.

4.1.3 Compiling the source code

It may be advisable to edit the format statement in `w_config.for` to upgrade defaults for the SIMFIT auxiliaries, or even alter this code to specify completely new defaults. After that, this command issued from the `C:\simfit6\dll\clearwin` folder

```
ftn95 *.for
```

will create `*.obj` files from all the `*.for` files in that local folder. Note that batch files `f.bat` are provided where compiler directives can be added if required to override the defaults placed by the command

```
ftn95 /config
```

into the file `ftn95.cfg`. In that case, the simple command

```
f *
```

can be used to create the `*.obj` files.

4.1.4 Linking the object code

This uses the Silverfrost linker `SLINK`.

To illustrate, if you issue the command

```
slink clearwin.link
```

from within `C:\simfit6\dll\clearwin`, then `SLINK` will use the link script `clearwin.link` to create `w_clearwin.dll`. A batch file `makeclr.bat` is provided to create `w_clearwin.dll`, and this can be edited to include the compilation phase as well if required.

You should not try to build the SIMFIT or SIMDEM packages using the Plato IDE, as it is infinitely better to use the batch and link files supplied with the source code to do this.

4.2 Example 2: NAGfor and w_menus.dll

As an example, the complete procedure for using NAGfor to create `w_menus.dll` will be described.

NAGfor creates intermediate C code that is passed to the `gcc` compiler for creating object code `*.o`, and also for linking. The `gcc` auxiliary program `windres` can be used to compile resources, and the `-compatible` compiler switch (formerly `-f77`) creates code according to the `stdcall` convention.

4.2.1 Compiling the source code

For instance, the command

```
nagfor -compatible -c *.for
```

issued from within `C:\simfit6\dll\menus` will create `*.o` files from all the `*.for` files in that folder.

4.2.2 Linking the object code

This uses NAGfor to pass link instructions on to `gcc`, and it will only work if there is an existing copy of `C:\simfit6\dll\clearwin\w_clearwin.dll`. This is only needed so the export table can be scanned to satisfy all the references.

For example, the command

```
nagfor @nagfor_menus.link
```

will create `w_menus.dll` using the link script `nagfor_menus.link`.

You should not try to build the `SIMFIT` or `SIMDEM` packages using the NAG Fortran Builder IDE, as it is infinitely better to use the batch and link files supplied with the source code to do this.

5 `SIMDEM` GUI

This consists of three DLLs.

```
w_clearwin.dll  
w_menus.dll  
w_graphics.dll
```

5.1 `w_clearwin.dll`

This must be compiled and linked using Silverfrost FTN95.

Do not use `/f_stdcall` for the standard Silverfrost version.
Use `/f_stdcall` for the NAG version.

Procedure A.

```
Change to C:\simfit6\dll\clearwin  
Type src ico_clr to compile the HTML code  
Type scc scroll_kludge to compile scroll_kludge.cpp  
Type f w_editor to create the module rp_editor_module  
Type f module_clearwin to create the module module_clearwin  
Type f * to cause the f.bat program to compile the object code  
Type makeclr to activate makeclr.bat
```

5.2 `w_menus.dll`

Procedure B.

```
Change to C:\simfit6\dll\menus  
Type f * to cause the f.bat program to compile the object code  
Type makemen to activate makemen.bat
```

The linker SLINK will report unsatisfied references if it cannot find `C:\simfit6\dll\w_clearwin.dll`.

5.3 `w_graphics.dll`

Procedure C.

```
Change to C:\simfit6\dll\graphics  
Type f module_savegks to compile the module_savegks  
Type f * to cause the f.bat program to compile the object code  
Type makegra to activate makegra.bat and  
link to w_clearwin.dll
```

The linker SLINK will report unsatisfied references if it cannot find C:\simfit6\dll\w_clearwin.dll

Repeat procedures A, B, and C (if SLINK reports unresolved references) until w_clearwin.dll and w_graphics.dll and w_menus.dll are all consistent.

6 SIMDEM executables

This is done in C:\simdem and requires local copies of w_clearwin.dll, w_menus.dll, and w_graphics.dll.

- To make the standard non /f_stdcall Silverfrost version

```
Use ftn95 /config to make sure /f_stdcall is switched off
Type make_SILVERFROST_simdem to activate make_SILVERFROST_simdem.bat
```

- To make the /f_stdcall Silverfrost version

```
Use ftn95 /config to make sure /f_stdcall is switched on
Type make_SILVERFROST_simdem to activate make_SILVERFROST_simdem.bat
```

- To make the NAGfor -compatible version

```
Type make_NAG_simdem to activate make_NAG_simdem.bat
```

7 FTN95 auxiliary items

For SIMFIT only, not SIMDEM you must first edit then compile dllchk.for.

The two auxiliary items are

1. The driver run6.exe = w_simfit.exe, and
2. change_simfit_version.exe.

If Silverfrost FTN95 is not going to be used then it would be easier to build a new w_simfit.exe driver from scratch.

7.1 w_simfit.exe

```
Change to C:\simfit6\work
Type getdll to make local copies of the SIMFIT DLLs available
Type f run6 to activate f.bat to create run6.obj
Type slink run6.link to create run6.exe
Type copy run6.exe to w_simfit.exe to create the SIMFIT driver
```

7.2 change_simfit_version.exe

```
Change to C:\simfit6\work
Type f change_simfit_version then slink change_simfit_version.link
```

8 Numerical analysis

The files concerned are

w_maths.dll and
w_numbers.dll

but there are several variants due to the fact that there are academic versions as well as NAG versions.

This is how the system works.

- Every installation of SIMFIT requires w_maths.dll and w_numbers.dll
- This pair must be consistent in any installation
- The only difference between versions of SIMFIT is in the pair of DLLs that are linked in
- In all versions: w_numbers.dll is completely free standing and includes BLAS and LAPACK
SIMFIT is dependent on this w_numbers.dll
- In the Academic version w_maths.dll is linked to w_numbers.dll
- Instead, in the NAG versions w_maths.dll is linked to the NAG DLLs.

This is how to prepare the DLLs

8.1 w_numbers.dll

Change to C:\simfit6\dll\numbers and type compile to activate
compile.bat then makenum to make w_numbers.dll

8.2 w_maths.dll

Change to C:\simfit6\dll\maths and type f* to activate f.bat,
then type makemat to make w_maths.dll and academic_maths.dll
Change to C:\simfit6\dll\nag and type make_all_nag to make the
NAG library linked versions. It will be necessary to study
and possibly edit make_all_nag.bat and the link files it calls.
It may be necessary to edit change_simfit_version.config if links to
the NAG library DLLs are required.

9 w_models.dll

Change to C:\simfit6\dll\models

Type f * to activate f.bat
Type makemod to activate makemod.bat

10 w_simfit.dll

Change to C:\simfit6\dll\simfit

Type f * to activate f.bat
Type makesim to activate makesim.bat

11 SIMFIT executables

Change to C:\simfit6\work

Type f * to activate f.bat
Type linkall to activate linkall.bat
Type makew to activate makew.bat

12 NAG library details

It should be noted that some of the information in this section refers to NAG routines that are no longer extant, because they have been deleted from the library. For example, j06sbf was in the obsolete NAG graphics library. However most of the functionality that was available in the former NAG graphics library is still available using the SIMFIT graphics procedures. Again, the old G05 routines for random number generators, and some other obsolete routines, are still referenced due to their extremely widespread use in SIMFIT but what happens in such cases is that there is extra code to call the newer replacement routines. When NAG routines are called, users can interactively edit all the control parameters described in the NAG documentation, but in some cases the SIMFIT routines have extra functionality and can call the routines with additional parameters, which is done by planting code that is activated when additional arguments are required.

12.1 NAG data files and models

The following SIMFIT test files are data sets and model equations taken from the NAG documentation that are used in SIMFIT to demonstrate the NAG library routines. These files are all available after using the[NAG] button of the SIMFIT files Open control, but in most cases they are presented as defaults anyway when the routine is called. The list of files is maintained in the file list.nag, and all that is required to add further files is to edit list.nag and place the new files in the SIMFIT file store, as list.nag is scanned for this list each time the [NAG] button is activated.

Models

| | |
|------------|----------------------------|
| c05adf.mod | 1 function of 1 variable |
| c05nbf.mod | 9 functions of 9 variables |
| d01ajf.mod | 1 function of 1 variable |
| d01eaf.mod | 1 function of 4 variables |
| d01fcf.mod | 1 function of 4 variables |
| e04fyf.mod | 1 function of 3 variables |

Data

| | |
|------------|---|
| c02agf.tf1 | Zeros of a polynomial |
| e02adf.tf1 | Polynomial data |
| e02baf.tf1 | Data for fixed knot spline fitting |
| e02baf.tf2 | Spline knots and coefficients |
| e02bef.tf1 | Data for automatic knot spline fitting |
| e04fyf.tf1 | Data for curve fitting using e04fyf.mod |
| f01abf.tf1 | Inverse: symposdef matrix |
| f02fdf.tf1 | A for $Ax = (\lambda)Bx$ |
| f02fdf.tf2 | B for $Ax = (\lambda)Bx$ |
| f02wef.tf1 | Singular value decomposition |
| f02wef.tf2 | Singular value decomposition |
| f03aaf.tf1 | Determinant by LU |
| f03aef.tf1 | Determinant by Cholesky |
| f07fdf.tf1 | Cholesky factorisation |
| f08kff.tf1 | Singular value decomposition |
| f08kff.tf2 | Singular value decomposition |

| | |
|------------|--|
| g02baf.tf1 | Correlation: Pearson |
| g02bnf.tf1 | Correlation: Kendall/Spearman |
| g02bny.tf1 | Partial correlation matrix |
| g02daf.tf1 | Multiple linear regression |
| g02gaf.tf1 | GLM normal errors |
| g02gbf.tf1 | GLM binomial errors |
| g02gcf.tf1 | GLM Poisson errors |
| g02gdf.tf1 | GLM gamma errors |
| g02haf.tf1 | Robust regression (M-estimates) |
| g02laf.tf1 | Partial Least squares X-predictor data |
| g02laf.tf2 | Partial Least Squares Y-response data |
| g02laf.tf3 | Partial Least Squares Z-predictor data |
| g02wef.tf1 | Singular value decomposition |
| g02wef.tf2 | Singular value decomposition |
| g03aaf.tf1 | Principal components |
| g03acf.tf1 | Canonical variates |
| g03adf.tf1 | Canonical correlation |
| g03baf.tf1 | Matrix for Orthomax/Varimax rotation |
| g03bcf.tf1 | X-matrix for procrustes analysis |
| g03bcf.tf2 | Y-matrix for procrustes analysis |
| g03caf.tf1 | Correlation matrix for factor analysis |
| g03ccf.tf1 | Correlation matrix for factor analysis |
| g03daf.tf1 | Discriminant analysis |
| g03dbf.tf1 | Discriminant analysis |
| g03dcf.tf1 | Discriminant analysis |
| g03eaf.tf1 | Data for distance matrix: calculation |
| g03ecf.tf1 | Data for distance matrix: clustering |
| g03eff.tf1 | K-means clustering |
| g03eff.tf2 | K-means clustering |
| g03faf.tf1 | Distance matrix for classical metric scaling |
| g03ehf.tf1 | Data for distance matrix: dendrogram plot |
| g03ejf.tf1 | Data for distance matrix: cluster indicators |
| g04adf.tf1 | ANOVA |
| g04aef.tfl | ANOVA library file |
| g04caf.tf1 | ANOVA (factorial) |
| g07bef.tf1 | Weibull fitting |
| g08aef.tf1 | ANOVA (Friedman) |
| g08aff.tfl | ANOVA (Kruskall-Wallis) |
| g08agf.tf1 | Wilcoxon signed ranks test |
| g08agf.tf2 | Wilcoxon signed ranks test |
| g08ahf.tf1 | Mann-Whitney U test |
| g08ahf.tf2 | Mann-Whitney U test |
| g08cbf.tf1 | Kolmogorov-Smirnov 1-sample test |
| g08daf.tf1 | Kendall coefficient of concordance |
| g08raf.tf1 | Regression on ranks |
| g08rbf.tf1 | Regression on ranks |
| g10abf.tf1 | Data for cross validation spline fitting |
| g11caf.tf1 | Stratified logistic regression |
| g12aaf.tf1 | Survival analysis |
| g12aaf.tf2 | Survival analysis |
| g12baf.tf1 | Cox regression |
| g13dmf.tf1 | Auto- and cross-correlation matrices |
| j06sbf.tf1 | Time series |

12.3 NAG DLL interface

In order for SIMF_T to run with any version of the NAG library, and to have additional functionality, like extra arguments, or calling obsolete routines, the named procedures just listed are not called directly from SIMF_T. What happens is that there is a set of dummy procedures with exactly the same argument lists as required by the NAG library, but they all have an additional dollar sign at the end of the named procedure. Inside the source code of such dummy procedures is a call to SIMF_T subroutine `putifa` so SIMF_T will always run with `IFAIL = -1`, but then write out NAG messages for nonzero `IFAIL` values, or results from iterative procedures, to a file called `nagifail.txt`. Some dummy procedures, of course, will also have the code for extra functionality referred to previously.

As an example, consider the subroutine `D01AJF` for quadrature. This would be accessed by a call as follows

```
CALL D01AJF$(F, A, B, EPSABS, EPSREL, RESUL, ABSERR, W, LW,
+          IW, LIW, IFAIL)
```

but this would be included in a version of `w_maths.dll` which linked in to the object code from compiling the subroutine `D01AJF$.F` coded as follows.

```
C
C
      SUBROUTINE D01AJF$(F, A, B, EPSABS, EPSREL, RESUL, ABSERR, W, LW,
+          IW, LIW, IFAIL)
C
      IMPLICIT NONE
      INTEGER IFAIL, LIW, LW, IW(LIW)
      DOUBLE PRECISION F, A, B, EPSABS, EPSREL, RESUL, ABSERR, W(LW)
      EXTERNAL D01AJF, F, GETIFA
      CALL GETIFA (IFAIL)
      CALL D01AJF (F, A, B, EPSABS, EPSREL, RESUL, ABSERR, W, LW,
+          IW, LIW, IFAIL)
      END
C
C
```

This mode of operation has several very considerable advantages.

- It is a trivial matter to update SIMF_T to use future versions of the NAG library, without having to change the SIMF_T source code.
- It is simple to shunt calls to obsolete routines into calls to newer procedures without needing to change the source code.

- The behavior of the NAG `IFAIL` mechanism can be changed by a one line edit.
- It is easy to create modules to run from within the SIMFIT environment that could link directly to the NAG DLLs, and so bypass the SIMFIT dollar sign mechanism if required.

It should be indicated that any executable made using the NAG Fortran Builder that is linked in to the SIMDEM GUI and calls the NAG library DLLs can be used as a module from within the SIMFIT environment.

12.4 NAG library updates

The only difference between alternative versions of SIMFIT is the file `w_maths.dll`. This is either linked to the SIMFIT numerical libraries, or one of the NAG library DLLs. The usual procedure would be to make a SIMFIT DLL stub, so that SIMFIT can be used with a new version of a NAG DLL that is not covered by the current SIMFIT distribution. This stub is then used by **change_simfit_version.exe** to overwrite the current version of `w_maths.dll` so that SIMFIT links to the NAG library.

The recommended procedure is first summarized, details are given, then a worked example is provided.

- Download and unzip `nagzip***.zip` from `www.simfit.org.uk`.
- Study a typical batch file such as `makenag_markxy.bat` which is for Mark xy.
- Make a copy of this file that just adds the new NAG DLLs to the SIMFIT repertoire.
- It may be necessary to edit a couple of other files referenced by this batch file as described below
- Run `makenag_markxy.bat` to create the new SIMFIT DLL linked to the NAG Mark xy DLL
- Add this new SIMFIT DLL to the SIMFIT distribution

The following details give a description of exactly what to do to take an existing compiled version of SIMFIT and make it link to a new version of the NAG DLLs.

It will be assumed that the Silverfrost-Salford FTN95 or NAG NAGfor compiler is going to be used and that the SIMFIT code has been unzipped into the folder `c:\simfit6\dll\nag` using the zip file `nagzip***.zip` distributed with the SIMFIT package. Once a certain amount of limited coding has been completed it is then only necessary to run the batch file `makenag_markxy.bat`, which compiles and links everything. To use different paths or alternative compilers a certain amount of extra editing would be necessary. In order to perform the upgrade it will be necessary to look at the file system defined in the next section, identify the extremely simple codes that are needed, act accordingly, then simply type

```
makenag_markx
```

to use FTN95 or, if NAGfor is to be used, type

```
makenag_markxy_nagfor
```

to create the upgrade to the NAG library at Mark xy.

Files needed to build the NAG DLL interface

1. Link scripts for the compiler

The files below are completed and only need to be edited if the paths to the NAG library DLLs have been changed.

One file is needed for each DLL to be created.

```
nag_mark20.link
mkl_mark21a.link
mkl_mark21z.link
mkl_mark22m.link
mkl_mark23m.link
nag_mark21a.link
nag_mark21z.link
nag_mark22m.link
nag_mark23m.link
mkl_mark23m_nagfor.link
nag_mark23m_nagfor.link
mkl_mark24m_nagfor.link
nag_mark24m_nagfor.link
```

2. The DLLs to be created

All of these DLL stubs can be created at each new release if required, which can be done by the makefiles `makenag_xy.bat` files. However, this requires archived copies of all previous DLLs and should not normally be used. It would be usual to make an edited copy of e.g. `makenag_23m.bat` to only create just one new version.

```
fld1120_maths.dll
fld11214a_mkl_maths.dll
fld11214z_mkl_maths.dll
fld11224m_mkl_maths.dll
fld11234m_mkl_maths.dll
fld11214a_nag_maths.dll
fld11214z_nag_maths.dll
fld11224m_nag_maths.dll
fld11234m_nag_maths.dll
```

3. The makefile

This is, for example, `makenag_mark23.bat` which does the following:

- a. Compile using FTN95
- b. Link
- c. Create the DLLs

Browsing `makenag_mark23.bat`, for example, will make all the above perfectly clear. It is only possible to make a DLL if the path to the NAG DLL in the link script points to an existing NAG DLL.

4. Other action required

Edit `change_simfit_version.config` and make sure this file, the file `change_simfit_version.exe`, and the dummy DLLs described above are distributed with the package.

Note that no action is required that involves the rest of the SIMFIT package. All that is needed to upgrade the SIMFIT package to use a new version of a NAG DLL is to make sure that the SIMFIT binary folder contains a copy of the new SIMFIT DLL linked to the new NAG DLL, and that the edited version of `change_simfit_version.config` has been used to overwrite the existing file `w_maths.dll`.

12.5 Example: Upgrading from Mark 22 to Mark23

This example should be imitated so that SIMFIT can be made link to future releases of the NAG library DLLs. It is important to note that any compiler can be used, not just FTN95 or NAGfor, and SIMFIT can be used

with any version of the NAG library without any recompilation of the SIMFIT code: all that is required is simple editing of some text files and the creation of a new stub linking SIMFIT to the new NAG DLLs.

At Mark 23 some of the routines used by SIMFIT from the F02 and G05 chapters were deleted. Now it would be extremely difficult to edit the SIMFIT code every time a routine is deleted. Instead, SIMFIT uses a dummy name so that the code can be called from the Academic maths library or any past, present, or future release of the NAG library. To understand how this is done please inspect the following files:

`f02_mark23.f`

for the F02 update and the file

`g05_mark23.f`

for the G05 update. Such a large redirection is not usually required, but was necessary at Mark 23 because some LAPACK routines had been omitted at Mark 22 and a wholesale upgrade to the random number generators was made available.

The steps required were as follows.

1. Copy `mkl_mark22m.link` to `mkl_mark23m.link` then edit.
2. Copy `nag_mark22m.link` to `nag_mark23m.link` then edit.
3. Copy `makenag_mark22.bat` to `makenag_mark23.bat` then edit.
4. Type `makenag_mark23` to create the new DLL stubs.
5. Check that the following new DLLs have been created
`f1d11234m_mkl_maths.dll` and
`f1d11234m_nag_maths.dll`.
6. Edit `change_simfit_version.config` to reference the Mark 23 DLLs.
7. Add the following files to the SIMFIT program folder
`change_simfit_version.config`
`f1d11234m_mkl_maths.dll` and
`f1d11234m_nag_maths.dll`.
8. As administrator, run the executable
`change_simfit_version.exe` in the SIMFIT folder.

12.6 Example: Upgrading from Mark 23 to Mark24

This is particularly easy as there were no routines used by SIMFIT that became obsolete. Here is an abbreviated form of `makenag_mark24.bat` which creates the dummy DLLs.

```
echo Step 1: Compile all the *.f source code (optional if all *.obj files exist)
ftn95 /f_stdcall getifa_ftn95.f95
ftn95 /f_stdcall *.f
```

```
echo Step 2: Create the new nag dll linked to the nag mark23m NAG DLL
slink nag_mark24m.link
```

```
echo Step 3: Create the new mkl dll linked to the mkl mark23m NAG DLL
slink mkl_mark24m.link
```

12.7 Compiling the NAG library source codes

This section adds additional information to the previous section on numerical analysis (page 15) so that users can appreciate how to compile selected routines instead of the whole NAG library replacement DLLs. The naglib zip files unzip into a maths folder containing the source codes for the NAG routines, and a numbers folder with subfolders containing auxiliary routines. A list of public domain software and acknowledgement of the programmers involved will be found in the SIMFIT reference manual `w_manual.pdf`.

The source codes used to replace some 215 library routines called by SIMFIT are a mixture of public domain subroutines, some edited to conform to the NAG library calling sequences, but with some subroutines created from scratch. This code only contains standard Fortran constructs and can be compiled using any Fortran compiler. Nevertheless, several things should be noted.

1. Some of the subroutines in the maths folders are dummy stubs for subroutines that are called by the NAG version of SIMFIT but are not called by the academic version of SIMFIT and they just return `IFAIL = -399`. Also many of the routines in the numbers subfolders are not called by the NAG library routines but are called from elsewhere in SIMFIT so, to avoid compiling the whole of the maths and numbers subroutines and just compile a particular NAG routine, it will be necessary to check for dependencies within the numbers subfolders and simply extract the code required.
2. The routines treat `IFAIL` as an intent (out) variable that is zeroized on entry to the routines. So the input `IFAIL` value is not used. However, as far as possible, the exit `IFAIL` values correspond to the NAG documentation, but the error trapping must be done by users supplying their own checking code for nonzero `IFAIL` exits, as I have done in the SIMFIT package.
3. The routines have exactly the same names as the NAG ones except for an added dollar character to the routine name. However the arguments are exactly the same.
4. Some of the routines use the workspaces dimensioned as for the NAG routines but some use additional workspaces, mostly created as temporary workspaces using `allocate`.
5. Some routines are as good, or even better, than the NAG routines, but some were thrown together in a hurry and are not so polished. I never got round to optimizing some code, particularly searching, sorting, selecting between accuracy and speed, avoiding repetition, or economizing on storage, and this is often indicated in the comments.
6. Users may wish to use their own implementations of packages like BLAS, LAPACK, and SLATEC.
7. The codes are nearly all in fixed format `*.for` style and, if free format `*.f95` code is preferred, you should use my SIMFIT program `for2f95`, as this is designed to maintain the readability built into the original code that will be destroyed by general purpose fixed to free translators.

13 Manual

Translating or extending the manuals will be very easy, since a very strict L^AT_EX style has been used. Programmers will observe that at one or two points handcrafting has been used (e.g. `\newpage`), and this will have to be edited. Note also that most of the diagrams are included as `*.wgb` files. The file `prolog.wgb` contains the PostScript header that has been cut out of the individual PostScript files to save space. By pasting `prolog.wgb` back into the `*.wgb` files they become `*.eps` files. Of course `dvips` only needs `prolog.wgb` once as a special. Note that `makeindex` is required to create the index. As `hyperef` is used, a call to `dvips` then `ps2pdf` converts the `*.dvi` file into `*.ps` and `*.pdf` with hyperlinks. By obvious editing in `w_manual.tex`, as in `mono_manual.tex`, a monochrome manual can be produced. Usually the package is distributed with `w_manual.pdf` in color with hyperlinks, but `mono_manual.pdf`, and `w_manual.ps` in monochrome for high resolution monochrome printing.

Programmers should definitely use the default folders otherwise it will be necessary to edit every call to included graphics files throughout the whole document.

```

C:\manuals          ...LaTeX w_manual      [1st pass]
                   LaTeX w_manual      [2nd pass]
                   Makeindex w_manual   [1st pass]

```

14 Distribution

To make the SIMFIT self-extracting installation program, use edited versions of the script `simfit.iss` and text file `infobefo.txt` with Inno Setup from

```

http://www.jordanr.cjb.net/
or
http://www.jordanr.dhs.org/.

```

In the case of SIMDEM the files are `simdem.iss` and `demobefo.txt`.

However, by editing the information files `infobefo.txt` and `demobefo.txt` if required, and analyzing the compilation scripts `simfit.iss` and `simdem.iss` to appreciate what paths are involved, any program can be used to distribute the packages.

15 Makefiles

It is important to note that if frequent changes of compiler are made then modules can become inconsistent. For this reason the object code generated for the SIMFIT package program files and the GUI DLLs

```

w_simfit.dll
w_graphics.dll

```

should be compiled twice in succession to make sure the correct modules are linked in.

The procedure with dedicated FTN95 scripts is described for SIMFIT while for SIMDEM using NAGfor is also illustrated with dedicated NAGfor commands. Check that all the batch files and link scripts have correct paths and that all subfolders exist and contain the necessary files. Also, make sure all signatures are updated and that SRC has been used to create objects from the icon `*.ico` and `*.rc` files then proceed as follows.

For FTN95 and the SIMFIT package the sequence of commands is:

```

ftn95 /config
cd c:\simfit6\dll\numbers
compile

```

```

makenum
cd c:\simfit6\dll\maths
f *
makemat
cd c:\simfit6\dll\clearwin
src ico_clr
scc scroll_kludge
f w_editor
f module_clearwin
f *
makeclr
cd c:\simfit6\dll\menus
f *
makemen
cd c:\simfit6\dll\graphics
f module_savegks
f*
makegra
cd c:\simfit6\dll\models
f *
makemod
cd c:\simfit6\dll\simfit
f orthog
f *
makesim
cd c:\simfit6\dll\help
makehlp
cd c:\simfit6\dll\nag
make_all_nag
cd c:\simfit6\work
getdll
src ico_sim6
src ico_run6
f *
linkall
makew
cd c:\setup\programs
update
cd ..
notepad infobefo.txt

```

Now run the Inno-setup compiler using `simfit.iss`, rename the `C:\setup\output\setup.exe` file appropriately and zip up.

For FTN95 and the SIMDEM package the sequence of commands is:

```

ftn95 /config
cd c:\simfit6\dll\clearwin
src ico_clr
scc scroll_kludge
f w_editor
f module_clearwin
f *
makeclr
cd c:\simfit6\dll\menus

```

```

f *
makemen
cd c:\simfit6\dll\graphics
f module_savegks
f *
makegra
cd c:\simdem
getdll
make_SILVERFROST_simdem
notepad demobefo.txt
cd c:\simdem\output

```

For NAGfor and the SIMDEM package the sequence of commands is to first use FTN95 as follows:

```

ftn95 /config
cd c:\simfit6\dll\clearwin
src ico_clr
scc scroll_kludge
f w_editor
f module_clearwin
f *
makeclr

```

which creates w_clearwin.dll. Then use

```

cd c:\nagfor\dll\menus
nagfor -compatible -c -w=x77 -f2003 *.for
nagfor @nagfor_makemen.link
cd c:\nagfor\dll\graphics
nagfor -compatible -c -w=x77 -f2003 module_savegks.for
nagfor -compatible -c -w=x77 -f2003 *.for
nagfor @nagfor_makegra.link
cd c:\simdem
get_nagdll
make_NAG_simdem
notepad demobefo.txt
cd c:\simdem\output

```

Now run the Inno-setup compiler using simdem.iss, rename the c:\simdem\output\setup.exe file appropriately and zip up. Single makefiles calling batch files can be used to compile and link these packages, but these may not be distributed with the source codes to avoid confusion. Following the above sequence of command lines should allow anybody to create their own makefiles.

16 64-bit versions

Note that the previous mechanism involving a pipe between the 32-bit and 64-bit binaries is discontinued.

From release 6.9.1 onwards 64-bit SIMFIT uses a new interface to 64-bit Clearwin+ in which all the calls such as

```
i = winio@
```

are now replaced by

```
i = winio\$.
```

This is so that the Clearwin+ code in SIMFIT can be compiled using NAGfor or gFortran. The 64-bit version of SIMFIT now uses exactly the same code as the 32-bit version, except for some temporary fixes that require additional features to construct the 64-bit equivalent of w_clearwin.dll.

The main differences between 64-bit SIMFIT and 32-bit SIMFIT are as follows.

- All executables begin with x64_ instead of w_.
- Object code is compiled using
NAGfor -abi=64 *.for -ieee=full -f2003 -w=all -c
although there is now more *.f95 free form source. For instance, with 64-bit gFortran,
gfortran %1.f95 -c -fno-underscoring -fdollar-ok -mwindows -Wall -Wextra
- The 64-bit files use different icons, compiled using 64-bit windres.
- The new DLLs are

```
x64_clearwin.dll    ... replaces w_clearwin.dll
x64_menus.dll      ... replaces w_menus.dll
x64_graphics.dll   ... replaces w_graphics.dll
x64_simfit.dll     ... replaces w_simfit.dll
x64_maths.dll      ... replaces w_maths.dll
x64_models.dll     ... replaces w_models.dll
x64_numbers.dll    ... replaces w_numbers.dll
```

- New run-time systems are required as follows

```
clearwin64.dll     ... run-time system for 64-bit Clearwin+
lib64f53.dll       ... run-time system for 64-bit NAGfor
libgcc_s_sjlj-1.dll ... run-time system for 64-bit gFortran
libgfortran-3.dll  ... run-time system for 64-bit gFortran
libquadmath-0.dll ... run-time system for 64-bit gFortran
```

- makefiles

The zip distribution has all the batch files and link files required to create 64-bit SIMFIT from the source files. For instance, to create x64_clearwin.dll the following sequence is required.

1. Create ico_x64_clr.o using windres with ico_x64_clr.rc in the clearwin folder.
2. Copy ico_x64_clr.o into the clearwin64 folder.
3. Use nag64 * to create *.o files and similar for *.o files from *.f95 files.
4. Use NAGfor @x64_clearwin.link to make x64_clearwin.dll.
